Motivation

- Fiscal policies to boost C in recessions

Motivation

- Fiscal policies to boost C in recessions
  - many different policies tried in many countries in recent decades

Motivation

- Fiscal policies to boost C in recessions
  - many different policies tried in many countries in recent decades
- Why so much variation in policies?

Motivation

- Fiscal policies to boost C in recessions
  - many different policies tried in many countries in recent decades
- Why so much variation in policies?
  - no guidance from traditional RANK models

Motivation

- Fiscal policies to boost C in recessions
  - many different policies tried in many countries in recent decades
- Why so much variation in policies?
  - no guidance from traditional RANK models
    - tiny MPC's: C stimulus ineffective

Motivation

- Fiscal policies to boost C in recessions
  - many different policies tried in many countries in recent decades
- Why so much variation in policies?
  - no guidance from traditional RANK models
    - tiny MPC's: C stimulus ineffective
    - away from ZLB, monetary policy should work

Motivation

- Fiscal policies to boost C in recessions
  - many different policies tried in many countries in recent decades
- Why so much variation in policies?
  - no guidance from traditional RANK models
    - tiny MPC's: C stimulus ineffective
    - away from ZLB, monetary policy should work
  - also likely variation in objectives:

Motivation

  - Away from ZLB, multipliers not necessarily much different in recessions
  - Far from clear if timing is right
- Robustness Exercise: HANK model

Quantitative Micro Realism

Idiosyncratic income process: Friedman/Muth (transitory and permanent shocks)

$$\mathbf{p} \quad - \quad \text{'permanent income'} \tag{1}$$
$$\xi \quad - \quad \text{'transitory income shock'} \tag{2}$$
$$\psi \quad - \quad \text{'permanent income shock'} \tag{3}$$

$$\begin{aligned} \mathbf{p}_{t+1} &= G\mathbf{p}_t\psi_{t+1} \\ y_{t+1} &= \mathbf{p}_{t+1}\xi_{t+1} \end{aligned} \tag{4}$$

Evidence?

For $n > 3$,

$$\operatorname{var}(\log y_{t+n}/y_t) = 2\sigma^2_{\log \xi} + n\sigma^2_{\log \psi} \tag{5}$$

Preferences, Beliefs, and Wealth

Infinite horizon model: target wealth depends on 'Growth Impatience' condition:

$$\underbrace{\left(\frac{(R\beta)^{1/\gamma}}{G\mathbb{E}[\psi^{-1}]}\right)}_{\text{'Growth Patience Factor'}} < 1 \tag{6}$$

Preferences, Beliefs, and Wealth

Infinite horizon model: target wealth depends on 'Growth Impatience' condition:

$$\underbrace{\left(\frac{(\mathrm{R}\beta)^{1/\gamma}}{G\mathbb{E}[\psi^{-1}]}\right)}_{\text{'Growth Patience Factor'}} < 1 \tag{6}$$

Degree of impatience (1-GPF) determines *size* of target

- If GPF ≥ 1, target is ∞

Preferences, Beliefs, and Wealth

Infinite horizon model: target wealth depends on 'Growth Impatience' condition:

$$\underbrace{\left(\frac{(R\beta)^{1/\gamma}}{G\mathbb{E}[\psi^{-1}]}\right)}_{\text{'Growth Patience Factor'}} < 1 \tag{6}$$

Degree of impatience (1-GPF) determines *size* of target

- If GPF ≥ 1, target is ∞
- if everybody has same GPF, target wealth is identical

Preferences, Beliefs, and Wealth

Infinite horizon model: target wealth depends on 'Growth Impatience' condition:

$$\underbrace{\left(\frac{(\mathrm{R}\beta)^{1/\gamma}}{G\mathbb{E}[\psi^{-1}]}\right)}_{\text{'Growth Patience Factor'}} < 1 \tag{6}$$

Degree of impatience (1-GPF) determines *size* of target

- If GPF ≥ 1, target is ∞
- if everybody has same GPF, target wealth is identical
- Fact: Wealth much more unevenly distributed than permanent income

Preferences, Beliefs, and Wealth

Infinite horizon model: target wealth depends on 'Growth Impatience' condition:

$$\underbrace{\left(\frac{(\mathrm{R}\beta)^{1/\gamma}}{G\mathbb{E}[\psi^{-1}]}\right)}_{\text{'Growth Patience Factor'}} < 1 \tag{6}$$

Degree of impatience (1-GPF) determines *size* of target

- If GPF ≥ 1, target is ∞
- if everybody has same GPF, target wealth is identical
- Fact: Wealth much more unevenly distributed than permanent income
- $\Rightarrow$ need heterogeneity in GPF

Preferences, Beliefs, and Wealth

Infinite horizon model: target wealth depends on 'Growth Impatience' condition:

$$\underbrace{\left(\frac{(\mathrm{R}\beta)^{1/\gamma}}{G\mathbb{E}[\psi^{-1}]}\right)}_{\text{'Growth Patience Factor'}} < 1 \tag{6}$$

Degree of impatience (1-GPF) determines *size* of target

- If GPF ≥ 1, target is ∞

  - Stimulus check for $1200 (means-tested)
  - Extension of unemployment benefits from 6 months to 1 year
  - Payroll tax cut by 2% for 2 years
- Evaluation criteria:
  - Spending multipliers
  - Welfare (only recession-related welfare impact)

Preview of results

- Welfare measure: Extension of UI benefits is the clear winner

Preview of results

- Welfare measure: Extension of UI benefits is the clear winner
  - Targeted at individuals with high MPCs and high recession-related welfare losses

Preview of results

- Welfare measure: Extension of UI benefits is the clear winner
  - Targeted at individuals with high MPCs and high recession-related welfare losses
  - But: higher spending may continue after recession is over

Preview of results

- Welfare measure: Extension of UI benefits is the clear winner
  - Targeted at individuals with high MPCs and high recession-related welfare losses
  - But: higher spending may continue after recession is over
- Spending multiplier: Stimulus check has the highest multiplier

Preview of results

- Welfare measure: Extension of UI benefits is the clear winner
  - Targeted at individuals with high MPCs and high recession-related welfare losses
  - But: higher spending may continue after recession is over
- Spending multiplier: Stimulus check has the highest multiplier
  - Not well targeted, but increases income immediately

Preview of results

- Welfare measure: Extension of UI benefits is the clear winner
  - Targeted at individuals with high MPCs and high recession-related welfare losses
  - But: higher spending may continue after recession is over
- Spending multiplier: Stimulus check has the highest multiplier
  - Not well targeted, but increases income immediately
- Tax cut

Preview of results

- Welfare measure: Extension of UI benefits is the clear winner
  - Targeted at individuals with high MPCs and high recession-related welfare losses
  - But: higher spending may continue after recession is over
- Spending multiplier: Stimulus check has the highest multiplier
  - Not well targeted, but increases income immediately
- Tax cut
  - Poorly targeted and much spending likely to occur after end of recession

Model

Consumer problem

- Education groups: "Dropout", "Highschool" and "College"

Consumer problem

- Education groups: "Dropout", "Highschool" and "College"
- Each group has distribution of discount factors β_i

Consumer problem

- Education groups: "Dropout", "Highschool" and "College"
- Each group has distribution of discount factors β_i
- Idiosyncratic, stochastic income process $\mathbf{y}_{i,t}$

Consumer problem

- Education groups: "Dropout", "Highschool" and "College"
- Each group has distribution of discount factors β_i
- Idiosyncratic, stochastic income process $\mathbf{y}_{i,t}$
- Estimated splurge factor ς: $\mathbf{c}_{sp,i,t} = \varsigma \mathbf{y}_{i,t}$

Consumer problem

- Education groups: "Dropout", "Highschool" and "College"
- Each group has distribution of discount factors β_i
- Idiosyncratic, stochastic income process $\mathbf{y}_{i,t}$
- Estimated splurge factor ς: $\mathbf{c}_{sp,i,t} = \varsigma \mathbf{y}_{i,t}$

Consumer problem

- Education groups: "Dropout", "Highschool" and "College"
- Each group has distribution of discount factors β_i
- Idiosyncratic, stochastic income process $\mathbf{y}_{i,t}$
- Estimated splurge factor ς: $\mathbf{c}_{sp,i,t} = \varsigma \mathbf{y}_{i,t}$
- Remaining consumption $c_{opt,i,t}$ is chosen to maximize utility

$$\sum_{t=0}^{\infty} \beta_i^t (1 - D)^t \mathbb{E}_0 u(\mathbf{c}_{opt,i,t}). \tag{7}$$

(D: end-of-life probability, u: stand. CRRA utility func.)

Consumer problem

- Education groups: "Dropout", "Highschool" and "College"
- Each group has distribution of discount factors β_i
- Idiosyncratic, stochastic income process $\mathbf{y}_{i,t}$
- Estimated splurge factor ς: $\mathbf{c}_{sp,i,t} = \varsigma \mathbf{y}_{i,t}$
- Remaining consumption $c_{opt,i,t}$ is chosen to maximize utility

$$\sum_{t=0}^{\infty} \beta_i^t (1 - D)^t \mathbb{E}_0 u(\mathbf{c}_{opt,i,t}). \tag{7}$$

(D: end-of-life probability, u: stand. CRRA utility func.)

- Budget constraint, given existing market resources $m_{i,t}$ and income state, and a no-borrowing constraint:

$$\mathbf{m}_{i,t+1} = R \underbrace{(\mathbf{m}_{i,t} - \mathbf{c}_{sp,i,t} - \mathbf{c}_{opt,i,t})}_{\geq 0 \text{ (no-borrowing constraint)}} + \mathbf{y}_{i,t+1} \tag{8}$$

(R: exogenous gross interest rate)

Income process

- Income subject to transitory, unempl. and permanent shocks

$$\mathbf{y}_{i,t} = \begin{cases} \xi_{i,t}\mathbf{p}_{i,t}, & \text{if employed} \\ 0.7\mathbf{p}_{i,t}, & \text{if unemployed for} \leq 2\text{q} \\ 0.5\mathbf{p}_{i,t}, & \text{if unemployed} \geq 2\text{q} \end{cases} \tag{9}$$

($\xi_{i,t}$: trans. shock, p: perm. income)

Income process

- Income subject to transitory, unempl. and permanent shocks

$$\mathbf{y}_{i,t} = \begin{cases} \xi_{i,t}\mathbf{p}_{i,t}, & \text{if employed} \\ 0.7\mathbf{p}_{i,t}, & \text{if unemployed for} \leq 2\text{q} \\ 0.5\mathbf{p}_{i,t}, & \text{if unemployed} \geq 2\text{q} \end{cases} \tag{9}$$

($\xi_{i,t}$: trans. shock, p: perm. income)

- "Permanent income": $\mathbf{p}_{i,t+1} = \underbrace{\psi_{i,t+1}}_{\text{perm. shock}} \quad \underbrace{\Gamma_{e(i)}}_{\text{educ.-specific growth}} \quad \mathbf{p}_{i,t}$

Income process

- Income subject to transitory, unempl. and permanent shocks

$$\mathbf{y}_{i,t} = \begin{cases} \xi_{i,t}\mathbf{p}_{i,t}, & \text{if employed} \\ 0.7\mathbf{p}_{i,t}, & \text{if unemployed for} \leq 2\text{q} \\ 0.5\mathbf{p}_{i,t}, & \text{if unemployed} \geq 2\text{q} \end{cases} \tag{9}$$

($\xi_{i,t}$: trans. shock, p: perm. income)

Income process

- Income subject to transitory, unempl. and permanent shocks

$$\mathbf{y}_{i,t} = \begin{cases} \xi_{i,t}\mathbf{p}_{i,t}, & \text{if employed} \\ 0.7\mathbf{p}_{i,t}, & \text{if unemployed for} \leq 2\text{q} \\ 0.5\mathbf{p}_{i,t}, & \text{if unemployed} \geq 2\text{q} \end{cases} \tag{9}$$

($\xi_{i,t}$: trans. shock, p: perm. income)

- "Permanent income": $\mathbf{p}_{i,t+1} = \underbrace{\psi_{i,t+1}}_{\text{perm. shock}} \underbrace{\Gamma_{e(i)}}_{\text{educ.-specific growth}} \mathbf{p}_{i,t}$

- Employment status is subject to a Markov process

Income process

- Income subject to transitory, unempl. and permanent shocks

$$\mathbf{y}_{i,t} = \begin{cases} \xi_{i,t}\mathbf{p}_{i,t}, & \text{if employed} \\ 0.7\mathbf{p}_{i,t}, & \text{if unemployed for} \leq 2\text{q} \\ 0.5\mathbf{p}_{i,t}, & \text{if unemployed} \geq 2\text{q} \end{cases} \tag{9}$$

($\xi_{i,t}$: trans. shock, p: perm. income)

- "Permanent income": $\mathbf{p}_{i,t+1} = \underbrace{\psi_{i,t+1}}_{\text{perm. shock}} \quad \underbrace{\Gamma_{e(i)}}_{\text{educ.-specific growth}} \quad \mathbf{p}_{i,t}$

- Employment status is subject to a Markov process
  - Unemployment rate education-specific (doubles in recession)

Income process

- Income subject to transitory, unempl. and permanent shocks

$$\mathbf{y}_{i,t} = \begin{cases} \xi_{i,t}\mathbf{p}_{i,t}, & \text{if employed} \\ 0.7\mathbf{p}_{i,t}, & \text{if unemployed for} \leq 2\text{q} \\ 0.5\mathbf{p}_{i,t}, & \text{if unemployed} \geq 2\text{q} \end{cases} \tag{9}$$

  ($\xi_{i,t}$: trans. shock, p: perm. income)

- "Permanent income": $\mathbf{p}_{i,t+1} = \underbrace{\psi_{i,t+1}}_{\text{perm. shock}} \quad \underbrace{\Gamma_{e(i)}}_{\text{educ.-specific growth}} \quad \mathbf{p}_{i,t}$

- Employment status is subject to a Markov process
  - Unemployment rate education-specific (doubles in recession)
  - Expected length of unemployment: 1.5q (4q in recession)

Income process

- Income subject to transitory, unempl. and permanent shocks

$$\mathbf{y}_{i,t} = \begin{cases} \xi_{i,t}\mathbf{p}_{i,t}, & \text{if employed} \\ 0.7\mathbf{p}_{i,t}, & \text{if unemployed for} \leq 2\text{q} \\ 0.5\mathbf{p}_{i,t}, & \text{if unemployed} \geq 2\text{q} \end{cases} \tag{9}$$

  ($\xi_{i,t}$: trans. shock, p: perm. income)

- "Permanent income": $\mathbf{p}_{i,t+1} = \underbrace{\psi_{i,t+1}}_{\text{perm. shock}} \quad \underbrace{\Gamma_{e(i)}}_{\text{educ.-specific growth}} \quad \mathbf{p}_{i,t}$

- Employment status is subject to a Markov process
  - Unemployment rate education-specific (doubles in recession)
  - Expected length of unemployment: 1.5q (4q in recession)
- Recession is given by an MIT shock; end of recession as a Bernoulli process (avg. length of 6q)

Aggregate demand effects

(as in Krueger, Mitman and Perri, 2016)

- Baseline: No feedback from aggregate consumption to income

Aggregate demand effects

(as in Krueger, Mitman and Perri, 2016)

- Baseline: No feedback from aggregate consumption to income
- Extension: We allow for aggregate demand effects from consumption on income during the recession

Aggregate demand effects

(as in Krueger, Mitman and Perri, 2016)

- Baseline: No feedback from aggregate consumption to income
- Extension: We allow for aggregate demand effects from consumption on income during the recession
- The AD effect is given by

$$AD(C_t) = \begin{cases} \left(\frac{C_t}{\tilde{C}}\right)^{\kappa}, & \text{if in a recession} \\ 1, & \text{otherwise,} \end{cases} \tag{10}$$

where $\tilde{C}$ is the level of consumption in the steady state.

Aggregate demand effects

(as in Krueger, Mitman and Perri, 2016)

- Baseline: No feedback from aggregate consumption to income
- Extension: We allow for aggregate demand effects from consumption on income during the recession
- The AD effect is given by

$$AD(C_t) = \begin{cases} \left(\frac{C_t}{\tilde{C}}\right)^{\kappa}, & \text{if in a recession} \\ 1, & \text{otherwise,} \end{cases} \tag{10}$$

  where $\tilde{C}$ is the level of consumption in the steady state.

- Idiosyncratic income in the extension model is then given by

$$\mathbf{y}_{AD,i,t} = AD(C_t)\mathbf{y}_{i,t}. \tag{11}$$

Results

Multipliers

$$M_t^P = \frac{\text{NPV of induced consumption up to } t}{\text{NPV of the cost of the policy}}$$

	Stimulus check	UI extension	Tax cut
10y-horizon Multiplier (no AD effect)	0.872	0.910	0.847
10y-horizon Multiplier (AD effect)	1.245	1.200	0.999
Share of policy expenditure during recession	100.0%	80.6%	57.6 %

Robustness: Multipliers in HANK

Welfare measure construction

Guiding principles

1. Each consumer is valued equally by the social planner
2. Utility from splurge in the same way as other spending
3. No social benefit to the policies outside of a recession

Simple aggregation of consumer util. only satisfies principle 1 & 2:

$$\mathcal{W}(\text{policy}, Rec, AD) = \frac{1}{N} \sum_{i=1}^{N} \sum_{t=0}^{\infty} \beta_S^t u(\mathbf{c}_{it,\text{policy},Rec,AD}) \tag{12}$$

Welfare measure construction

Guiding principles

1. Each consumer is valued equally by the social planner
2. Utility from splurge in the same way as other spending
3. No social benefit to the policies outside of a recession

Simple aggregation of consumer util. only satisfies principle 1 & 2:

$$\mathcal{W}(\text{policy}, Rec, AD) = \frac{1}{N}\sum_{i=1}^{N}\sum_{t=0}^{\infty}\beta_S^t u(\mathbf{c}_{it,\text{policy},Rec,AD}) \tag{12}$$

To satisfy principle 3, we calculate

- Net welfare: Subtract the welfare cost of financing the policy

- The stimulus check is less well targeted, but...

Conclusion: Comparing the policies

- Comparison of three consumption stimulus policies in a HA model consistent with data on the distribution of liquid wealth and intertemporal MPCs
- Welfare measure: UI extension is the clear bang-for-the-buck winner
- The stimulus check is less well targeted, but...
  - is transferred immediately ensuring that money arrives when it is most valuable

Conclusion: Comparing the policies

- Comparison of three consumption stimulus policies in a HA model consistent with data on the distribution of liquid wealth and intertemporal MPCs
- Welfare measure: UI extension is the clear bang-for-the-buck winner
- The stimulus check is less well targeted, but...
  - is transferred immediately ensuring that money arrives when it is most valuable
  - is more easily scaled up to provide more stimulus

Conclusion: Comparing the policies

- Comparison of three consumption stimulus policies in a HA model consistent with data on the distribution of liquid wealth and intertemporal MPCs
- Welfare measure: UI extension is the clear bang-for-the-buck winner
- The stimulus check is less well targeted, but...
  - is transferred immediately ensuring that money arrives when it is most valuable
  - is more easily scaled up to provide more stimulus
- The tax cut is both poorly targeted and may yield substantial spending after the recession is over

Conclusion: Comparing the policies

- Comparison of three consumption stimulus policies in a HA model consistent with data on the distribution of liquid wealth and intertemporal MPCs
- Welfare measure: UI extension is the clear bang-for-the-buck winner
- The stimulus check is less well targeted, but...
  - is transferred immediately ensuring that money arrives when it is most valuable
  - is more easily scaled up to provide more stimulus
- The tax cut is both poorly targeted and may yield substantial spending after the recession is over
- Framework can be used to evaluate other candidate policies

Appendix

Parameters describing the policies

Parameters describing policy experiments	
Parameter	Value
Change in unemployment rates in a recession	$\times 2$
Expected unemployment spell in a recession	4 quarters
Average length of recession	6 quarters
Size of stimulus check	\$1,200
PI threshold for reducing check size	\$100,000
PI threshold for not receiving check	\$150,000
Extended unemployment benefits	4 quarters
Length of payroll tax cut	8 quarters
Income increase from payroll tax cut	2 percent
Belief (probability) that tax cut is extended	50 percent

Simple aggregation of consumer util. only satisfies principle 1 & 2:

$$\mathcal{W}(\text{policy}, Rec, AD) = \frac{1}{N} \sum_{i=1}^{N} \sum_{t=0}^{\infty} \beta_S^t u(\mathbf{c}_{it,\text{policy},Rec,AD}) \tag{13}$$

- $\mathbf{c}_{it,\text{policy},Rec,AD}$: consumption paths (including splurge) for each consumer / policy

Welfare measure construction

Guiding principles

1. Each consumer is valued equally by the social planner
2. Utility from splurge in the same way as other spending
3. No social benefit to the policies outside of a recession

Simple aggregation of consumer util. only satisfies principle 1 & 2:

$$\mathcal{W}(\text{policy}, Rec, AD) = \frac{1}{N}\sum_{i=1}^{N}\sum_{t=0}^{\infty}\beta_S^t u(\mathbf{c}_{it,\text{policy},Rec,AD}) \tag{13}$$

- $\mathbf{c}_{it,\text{policy},Rec,AD}$: consumption paths (including splurge) for each consumer / policy
- $Rec \in \{1,0\}$: recession indicator, $AD \in \{1,0\}$: AD ind.

Welfare measure construction

Guiding principles

1. Each consumer is valued equally by the social planner
2. Utility from splurge in the same way as other spending
3. No social benefit to the policies outside of a recession

Simple aggregation of consumer util. only satisfies principle 1 & 2:

$$\mathcal{W}(\text{policy}, Rec, AD) = \frac{1}{N}\sum_{i=1}^{N}\sum_{t=0}^{\infty}\beta_S^t u(\mathbf{c}_{it,\text{policy},Rec,AD}) \tag{13}$$

- $\mathbf{c}_{it,\text{policy},Rec,AD}$: consumption paths (including splurge) for each consumer / policy
- $Rec \in \{1, 0\}$: recession indicator, $AD \in \{1, 0\}$: AD ind.
- $\beta_S = 1/R$: social planner's discount factor

Welfare measure construction II

To satisfy principle 3 we define $\mathcal{C}(\text{policy}, Rec, AD) =$

$$\Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, Rec, AD) - \mathcal{W}(\text{None}, Rec, AD)}{\mathcal{W}^c}}_{\text{I}} - \underbrace{\frac{PV(\text{policy}, Rec)}{\mathcal{P}^c}}_{\text{II}}\Bigg)$$
$$- \Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, 0, 0) - \mathcal{W}(\text{None}, 0, 0)}{\mathcal{W}^c}}_{\text{III}} - \underbrace{\frac{PV(\text{policy}, 0)}{\mathcal{P}^c}}_{\text{IV}}\Bigg)$$

- I: Policy-induced increase in agg. welfare (in bp of SS-cons.)

Welfare measure construction II

To satisfy principle 3 we define $\mathcal{C}(\text{policy}, Rec, AD) =$

$$\Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, Rec, AD) - \mathcal{W}(\text{None}, Rec, AD)}{\mathcal{W}^c}}_{\text{I}} - \underbrace{\frac{PV(\text{policy}, Rec)}{\mathcal{P}^c}}_{\text{II}}\Bigg)$$
$$- \Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, 0, 0) - \mathcal{W}(\text{None}, 0, 0)}{\mathcal{W}^c}}_{\text{III}} - \underbrace{\frac{PV(\text{policy}, 0)}{\mathcal{P}^c}}_{\text{IV}}\Bigg)$$

- I: Policy-induced increase in agg. welfare (in bp of SS-cons.)
- II: Cost of policy $\Leftrightarrow$ I - II: Net agg. welfare increase

Welfare measure construction II

To satisfy principle 3 we define $\mathcal{C}(\text{policy}, Rec, AD) =$

$$\Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, Rec, AD) - \mathcal{W}(\text{None}, Rec, AD)}{\mathcal{W}^c}}_{\text{I}} - \underbrace{\frac{PV(\text{policy}, Rec)}{\mathcal{P}^c}}_{\text{II}}\Bigg)$$
$$- \Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, 0, 0) - \mathcal{W}(\text{None}, 0, 0)}{\mathcal{W}^c}}_{\text{III}} - \underbrace{\frac{PV(\text{policy}, 0)}{\mathcal{P}^c}}_{\text{IV}}\Bigg)$$

- I: Policy-induced increase in agg. welfare (in bp of SS-cons.)
- II: Cost of policy $\Leftrightarrow$ I - II: Net agg. welfare increase
- III - IV: Net welfare impact of policy outside of recession

Welfare measure construction II

To satisfy principle 3 we define $\mathcal{C}(\text{policy}, Rec, AD) =$

$$\Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, Rec, AD) - \mathcal{W}(\text{None}, Rec, AD)}{\mathcal{W}^c}}_{\text{I}} - \underbrace{\frac{PV(\text{policy}, Rec)}{\mathcal{P}^c}}_{\text{II}}\Bigg)$$
$$- \Bigg(\underbrace{\frac{\mathcal{W}(\text{policy}, 0, 0) - \mathcal{W}(\text{None}, 0, 0)}{\mathcal{W}^c}}_{\text{III}} - \underbrace{\frac{PV(\text{policy}, 0)}{\mathcal{P}^c}}_{\text{IV}}\Bigg)$$

- I: Policy-induced increase in agg. welfare (in bp of SS-cons.)
- II: Cost of policy $\Leftrightarrow$ I - II: Net agg. welfare increase
- III - IV: Net welfare impact of policy outside of recession
- $\mathcal{C}$ measures only welfare effects beyond pure redistribution
